Subject: Nvidia GTX 570 + Renegade?

Curious if anyone is using the Nvidia GTX 570 chipset to play Renegade. The ACTUAL card is an EVGA 025-P3-1579-AR.

The reason I ask is because on my new build, I can only get Renegade to work in windowed mode. In fullscreen the screen just turns black, but the sound works and I can hear the controls operating correctly.

If anyone can confirm that they're using this card then I know it's not a hardware incompatibility and can look elsewhere for solutions.

Thanks!

Until very recently I've been using an EVGA 012-P3-1572-AR (same chip, less RAM and factory overclocked by 100mhz) without any problems. I upgraded to a GTX 670 for "various" reasons.

You can do that?

Triple head with Renegade? Man, that's the shit

Well, I did take a picture of it There are a couple of issues with the HUD (it's attached to the edges of the outer monitors), but I'm working on fixing that.

Mother of God.

Good to know that you got it to work on this chipset. I chose the Nvidia 500 series over the 600 series due to higher performance in productivity apps (500's) vs games (600's). Price knocked me from the 580 to the 570.

Here are a couple of shots of my new setup:

would be nice to make a good looking hud with all 3 of those.
