---

another floating c4 trick is to take an apc then be an technician or hotwire then place prox mines on the same spot on the fron of the apc. if done right the c4 carges should protrude in an upward forwards line. dont use over 30 c4 on it cause then the first in the chain will dissappear and so will the rest of the chain. after that charge into a building or tank and watch what happens. dont worry if the chain ggoes "under" the vehicle while driving it will explode all the same.
