i go into the server i want and its suppose to run renguard and ask u if u want it running or not for that server while ur playing...but it doesnt do that, i know this because it does that on my brothers comp when he plays over gamespy3d. i think it has something to do with the 2 game.exe files (the names are game.exe & game2.exe)....i need to get renguard working so i can play my bro over noobstories server1 which has renguard protection.
