When it runs, it runs fine. FPS is usually in the 30s, I know it would be higher if I had a better video card. This is renegade we're talking about here, not HL2, my processor double the requirements and the memory is 3x the required amount. I'm sorry I don't have and ubar-1337 system like you do. BTW, my sound works fine.

edit

There are never any error messages. It just crashes to the desktop. Sometimes Renguard gives me an error about a corrupted always.dbs, other times not. Though that's only started happening since CP1.
