j\_ball430glyde51 Your own server is WAY better, and only limited by what YOU can do. I'd prefer splitting the cost of a dedicated server, right, Ty?

Dedicated server? Wha?

Since I'm still a n00b to the overall internet, I must say that getting your own server is still the best option. Just run it 24/7, keep it in a closet or somewhere convinient where it can get the ventelation it needs, and run it using your internet connection. You can remotly connect to change the server and such. Of course, for this you need at least DSL and your ISP service must give you unlimited bandwidth, like mine

I run my server off of my Personal Computer using Abyss Web Server. Takes up less memory than Firefox, can run PHP, ASP, and Perl scripts (installation seperate) and is easy for most people to use. Also, it doesn't take up 20mb of space, it takes less than 1mb.
