Subject: Renegade Config Problem?

it means that on your computer you are putting a setting in (on the renegade config) that your computer cannot handle, for example say you are telling it to use multi-pass lightmapping and his comp can't do that. though, I thought renegade would default to safe settings if that happened.

best advice, let the config come up again, turn your resolution to 640 * 480, 16-bit colour mode, turn off everything in the third tab, use miles-fast 2D positional audio, turn all your video details to lowest* and try again. if it works then there is a setting that you must turn off, but everything else is fine.

*to turn down video details go to desktop properties, settings tab, advanced, and you should see a tab for your 3D card.
