No, 100% would be the full screen, it would resize according to resolution. there is no definite formula to work it out. You should also use more than one browser too, and more than one pc if possible to make sure it works on all kinds of machines.

Some program like Dreamweaver or Frontpage (if that's what the thing is) would help too, and if you want to learn the code, just display it and see what everything does.

Furthermore a tutorial book would work wonders. I have some and could make pretty much anything anyone wants me to make, but I'm not artistic in the slightest.. ergo no site for me..

If you had a 100 pixel wide picture on a 1000 pixel wide screen, then to keep it the same size you would need to size it at 10%, yes?
