First you need to access the database

The variables will have to be set, your host, username, password and the database being used.

Then you'd want to create a table and database, let's name these both "temp" for now.

Two columns, page and html

blah.php?page=whatever

```php
$page = $_REQUEST['page'];

$link = mysql_connect($sql_host, $sql_user, $sql_pass);
mysql_select_db(temp, $link);

$result = mysql_query("SELECT * FROM `temp` WHERE page='$page'");
$myrow = mysql_fetch_array($result);

echo $myrow[html];
```

Note: this is a VERY simple sample of what code would be used.
