Lijitsu wrote on Mon, 06 June 2005 01:26: OLD Microwave. This thing was easily two foot, eight inches wide, and a foot and a half tall. It wasn't digital, either, to get set the time, you had to turn a dial. Not only that, but you had to set it to something over 30 seconds, then bring it back down to the time you wanted if you wanted below thirty seconds. And it was a Pot Pie, if that helps at all. Should have seen my mom. Hell, fuck that, my dad. Dear lord i couldn't sit down for a week after that.

Old, new, digital controls or a dial, it doesn't matter, they've always used the same kind of technology for the heating parts/magnetron/etc.

Simply putting metal in a microwave will not cause it to explode, the only thing it could do is cause a fire if it's attached to something flammable like paper and is heated enough.
