DJM wrote on Fri, 12 August 2005 15:42I honestly on a 2.6GHz Processor and 1gb pci2700 DDR RAM (333MHz)

Here's your problem there ^

first of all, I think you mean a p4 2.66 ghz with DDR333 or your saying 2.6 ghz in AMD rating well, it's actually like 2 ghz.

Your fast video card is to fast for your other component's so it doesn't get to its max. if you have a Athlon XP or p4D under 3ghz+

It's kinda a waste buying such a good card because the card cant reach its full potential. If you want it to run at its full look more in the way of a AMD 64 3500+ or p4 3.8Ghz

Still a verry good gfx card though.
