The difference between the scientific theories and the religious claims (which in essence, as far as "religion" go, are considered facts to them), which are actually merely theories, is that scientific theories can be tested for continuity. It's not possible (or easily possible) to do the same when you're trying to affirm something in the Bible.

It's easy to say and prove that God exists, but it isn't so easy to prove that the Bible is His truth, and is thus infallible. That's why I think that God absolutely SHOULD be taught in schools as a theory as much as the THEORY of conservation of energy/mass/momentum/etc. I, however, do not think that any type of theoretical morality should be taught outside a philosophy classroom; where the opinion of the matter is stressed, and no objectives are established. This allows people the reason their own morality based on what they know, and not what some pompous Vatican lacky in a big hat says morality is.
