The most expensive computers I have seen are the go-I ones (<http://www.go-i.com/home/index.htm>). I once speced out a PC there that was \$40,000 lol. They have some really awesome custom laptops too, and crazy shit like RAID arrays of non-mechanical hard disks (PureRAM)

Quote: Introducing the first desktop computer configurable WITHOUT a system hard drive. The Operating system and system files reside on a PuRam™ solid state flash disk with near zero latency and seek times, and burst transfer rates up to 8.5GB/s I/O, capable of over 150,000 I/O requests per second, all with an average of 0.0% CPU utilization. This translates into an effective desktop business productivity of up to 100 times faster than the fastest available hard disk design at any price or configuration. These are non-volatile units just like a regular hard drive with a permanent storage cycle. There are no more virtual memory or swap file delays (since now they are as fast as RAM) and there are no more System Disk Defrags (memory is random so it does not need defragging). Windows boots-up in seconds, load your games and apps in seconds, and start any program virtually instantly. Also moving, copying, or working on large files has literally no slow-down affect in the blistering fast computing speed. Furthermore, PuRam™ Drives are extremely resistant to shock, vibration and temperature variations, while providing unprecedented performance and superior durability. Allied to our CacheFlow™ technology, the PuRam™ Drives give your audio, video, CAD, graphic, gaming, industrial or scientific applications the most, compelling and unmatched data through output speeds. Absolutely like no other.

Even the lowest model go-I computers put Alienware stuff to shame, it's like comparing a Ford Pinto and the Space Shuttle.
