The use of White phosphorus as a weapon is not what is in question, it's the effects it has. Bombs kill civvies just as easily as WP. What my question is: how fast does WP burn? Depending on the speed of the burn the person may die instantly, which is the same as a normal bomb blast.

I tried to look it up, but thanks to the obnoxiousness of the media, all I got was reprints of the same article posted at the beginning of this thread
