what it should be is the more tuned you are to a mathematical way of thinking, the harder it is. (Which is why the games/simulation course is stated). If you have a different way of thinking that simply in mathematical terms, you will get it much easier. You may, in fact, be "smarter" than the doctor, but in terms different than how he thinks. Philosophical thinking (or at least the things surrounding that type of thinking), for example, is how I came across the answer that fast. I would never come close to the math ability of the doctor, but that doesn't mean I'm stupid; in any way.
