Well, it's kind of a long story. I took a whole month off of Renegade, and in the meantime get a wireless router (I'm still wired to the connection, but my connection is going through the router) and the router (a D-Link DI 624) keeps disconnecting and having connection problems. I've read on a few sites, and just about 90% of all people with this router complain of the same problems that I am experiancing.

So anyways, I took a month off, I got a wireless router shoved into my internet connection and yesterday in the UNRULES GSA server I get on Renegade for the first time in oh so long and much to my surprise a new Renguard patch and a new Core Patch were out. So, I downloaded those, ran, and it all ran fine. So I play for a bit, get disconnected here and there from my wireless router and then get off Renegade.

A few hours later I get back on for the UNRULES Fun War and start playing. Upon entering though, I notice lag, and lots of it... My ping is not the constant 70 that it usually is, but 350+, I lag horribly, having a 2 second or so delay, and on top of that, I'm not sure what the problem is as I get kicked off by Renguard saying that I'm using a LAN exploit.

So now, your all probably saying that it's my wireless routers fault (and this is what I think it is too). However, I was just wondering if the new Renguard update or perhaps CP2 have caused others connection problems, as it can just as equally be any one of those two too...

Anyways, I personally believe it's the routers fault and so I'll try and get it out of here, although I doubt that I'll be able to...

I'd like to hear some opinions as to what the problem might be, if anyone has any...

Thanks,
~Banjo1231
