I have been experiancing problems with WOL lately which i think is the fault of RE WOL. I installed it for about a week when wol stopped working. I installed it through br.net but can't disable it because i uninstalled and the backup of the host file is probably gone (yes i tried reinstalling). I use a DI-604 D-link router with the latest firmware but i never experianced any problems with it before. i tried getting on WOL with another comp in my network and it worked. BTW, this happens for every game that uses WOL.
