i switched pc's and found out (re)installing renegade was a problem...

i tried the tutorial on the renguard forums but they are a bit out dated.

ill explain the u have to take if u want to (re)install renegade.

First thing u have to do is install renegade like u normaly would, use your own serial and stuff.

Then u need to download the latest renegade patch (1.037) [here](#).

Start renegade up and goto the serverlistings, then quit renegade.

download core patch 1 [here](#).

After u installed cp1 u need to start renegade and log on to wol(xwis) just goto the serverlistings screen and then exit renegade again.

[Note for McAfee users: u have to add "game.exe" from the renegade dir to your "allowes programes list"]

Then download renguard from the offical renguard website found [here](#)

Install renguard and start it, it will ask u f u want to install the latest corepatches, say 'yes' and just let it do it's thing.

after its all done and renguard doesnt come whying about stuff and u wanna play renegade just start any shortcut made by u or the renegade insstallation or start "game.exe". If u wanna play renegade with out renguard start "game2.exe"

[Note for McAfee users: u have to add "game.exe" again (so remove it from the list and re-add it) and "Game2.exe" from the renegade dir to your "allowes programes list"]

this only works for the 'normal'/'original' renegade, so not for The First Decade
