Ok, it from the video I see that it detects the HDD. Go to onboard device configuration > IDE Function setup, tell me or show what is under there. Same with the Serial-ATA configuration right below.

Also make sure your boot startup is set to CD-ROM > HDD.

I can't remember how I fixed it but I had the same problem. It was an option in the BIOS, make sure it's set to SATA. Even after that though, it was still a bitch to get the OS on the drive.

After I got it on the drive, everything was good though.
