Nukelt15 wrote on Fri, 28 July 2006 16:47 Higher forces, indeed- then again we are higher ourselves than some other forces. So what is to say that each higher force does not have another, even higher force above it, ad infinitum? Are there really any limits, or is it merely easier to picture the universe when it can be put in perspective using an imagined solid frame of reference?

Not trying to say anybody is right or wrong, but if infinities are possible- which they certainly are, at least in the form of the infinite nothingness that is space- why can there not be an infinite number of different levels of existence, which would mean that there is no ultimate force or power?

Sure it's possible. In which dimension do you mean infinite though? In size? Distance? Both? Or perhaps in the way that the universe is "pulsing", expanding and collapsing again and again. I have to admit that current science quite firmly shows that objects can't be of infinite size. And with that mean, objects aren't infinitely small. However, quantum science or whatever is still in early stages, who knows what we'll find from inside, say....electrons. As far as I know, they're currently just some negatively charged "things", we don't really know what we would see if we could zoom closer...

Anyway, it still wouldn't answer the basic question, "What's the meaning of life?". We would no doubt keep expanding and adventuring farther away from home in order to become the new God, even if we knew that we can't have everything...you know, just because we can.
