What the hell is using the CMD prompt, and why? I would boot into safe mode and kill whatever is accessing the CMD prompt.
Try booting into safe-mode F8, or F1 or Esc or Del during boot. It should give you a menu like, boot into safe mode, boot into safe mode with networking, last known good configuration, reboot and so on. Choose the last known good configuration and cross your fingers. If that doesn't work boot into safe mode and get control of your command prompt. You need that and it's probably the root of all your troubles. Once you do that you can use the system file checker sfc.exe
