You don't want to install the software. Just take the drivers from the disk and make sure there in the system folder. Hence, put the disk in and kill the auto start. Open control panel -> System Properties -> the Hardware Tab -> Device Manager -> scroll down to mouse properties and open it up to the drivers tab. Select update driver -> HELL NO windows cannot connect to the intranet -> install from specified location (advanced lol) and point it to the disk and let it search for the correct dll.

All this is a moot point if you are running XP, as it should already have the drivers installed.

However, you can unplug and uninstall the mouse and pointing devices completely. Shut down -> plug it back in and Reboot. Windows should automatically start the device manager and configure the shit accordingly.
