I don't find looking at us as part of the universe awe inspiring. I find the concepts of eternity and infinity much more interesting. I mean as humans we can't grasp eternity. And infinity goes hand in hand with eternity. I mean there is endless spaces of empty universe that matter can expand into during eternity. And what will it be like to spend eternity in the afterlife? How can we measure eternity? And how can we fathom eternity in the past? I mean before the big bang there was still time. And how was the matter in the past if matter existed for eternity? And infinity, what if matter was infinite? That would mean the universe could be one of many universes. Our universe has a fixed amount of matter and energy (according to the laws of physics that matter or energy can't just appear out of nothing). Yet if matter was infinite then there would have to be other universes. But then again who can say matter is infinite. And what if infinity didn't exist. What if the universe didn't have the space to expand infinitely. That would mean eventually our finite matter would reach the end of the finite space and have a finite amount of time to place all its matter in a finite amount of combinations. All things would need an eternity to think over.
