Subject: I am a stats whore.

Some of you might know, I have been collecting stats on all the servers on the RenGuard network. The stats include your max player count and the current number of players in your server.

This spreadsheet is compiled from data from September 8th, 2006 until today. It lists the average player count in your server and the resulting percentage utilization of your server. (Example, if your server averages 8 players out of 16, then you have 50% utilization.

Please note that if you changed the name of your server then your data got split up into each name and I'll have to hand-compile your actual figure if you want it.

Also, please note that this ONLY works for servers on the RenGuard network. I don't collect stats for non-RG servers.

For reference, the top 10 servers for player population are:

name avg(s.players) max_players percentage n00bstories.com AOW/CCM 37.6384 40 94.096 n00bless.com All Out War 24.3332 32 76.04125 Jelly-Server [Mini AOW] 13.5967 20 67.9835 www.Jelly-Server.com 25.4081 42 60.49547619 -=[DW War Sniper]=- 5.1000 10 51 Fnfall's AOW Server 17.9662 36 49.90611111 ~XpHaZe Marathon~ 15.6052 32 48.76625 [DS] Black-Cell.net - Marathon 15.5245 32 48.5140625 -=[DW Train Server]=- 4.7652 10 47.652 -=[DW War Server]=- 5.1883 12 43.23583333

(I removed from consideration those servers that look like they weren't up for very long and therefore had skewed ratings. I'll probably run my query again with a record count so I know for sure which results are reliable.)
