Theres nothing for him to learn that he doesn't already know. He unpacked the protected executable, he unencrypted and sniffed the RG network protocol. He knows how to make an aimbot. He knows the IPs of the master servers. We are all but helpless against someone with the skillset of 0x90 or v00d00. People who can hack their own windows kernel can do literally anything on a PC.

In short, he could easily crack 1.04, no matter how good it was - even if it was coded by a team of 1000 experts, simply because anything on a PC can be hacked if you have the skills, motivation, and the time.

Fortunately, he seems more interested in the implementation of RG, than destroying Renegade. He has already written a bypass, and realized how much it hurt us, including financially. I am hoping that he will want to satisfy his need for a challenge by helping us rather than hurting us.
