My wife has 2 worms that have been quarantined by AVG. Generic worm BAF + BAG.

Both are isolated but unhealable.

I googled the worm and ended up at the Sophos website, followed the repair to the letter but the worm is still there.

Where in the registry will I find the worm? Do I use "regedit"?

Something is causing major lag, unopenable anti-virus and I.E. to freeze.

Virus scans are clean as are spyware. Both have been run in safe mode. As soon as you go back to normal then the above faults still exist.

O.S. is XP-pro.
