I'm not entirely sure why this happens, but gkl21 sent me this earlier:

[15:24:10] [gkl21]: While using your WOL Proxy script, we randomly get this error

[15:24:10] [gkl21]: \* /sockopen: insufficient parameters (line 135, WOLproxy.mrc)

[15:24:11] [gkl21]: So I Added -> set %WOL\_active \$remtok(%WOL\_active, %cur, 1, 32)

[15:24:11] [gkl21]: and now no issues creating nor got this issue again..

[15:25:08] [gkl21]: When we get that error, just loops on that error line (sockopen ..... line 135)

and it wont' come back up. Since the \$remtok is at that spot now (added before line 135) it's fine
