Ready, this is how it is broken down. *ahem*

Long, long ago, before the creation of the Earth, there was a similar planet to earth on a far off star system. On this planet, Humanoid beings (I say humanoid because environment effects changes in the way life survives) lived there. Well, there was this problem, and in their years of living, they mastered genetics and understood basic space travel and transport.

What they did, was they genetically encoded their DNA and Genes and micro life onto this LARGE rock... possible more than 1 rock.

They launch this(ese) rock(s) into space hoping that they will one day find a suitable home, and grow into a new life.

Now, early in the life of Earth, before the atmosphere was created, the Earth was pelted with hundreds of thousands of meteors a day! Whos to say that one of these rocks was (one of) the rock(s) that 'they' launched into space for spices survival?

A meteor that carried the seeds of life, crashed into Earth, and spread life out once again.

This actually ties into this thread. The meaning of life, to go on living and proving we live. To live for those who sent us here, who gave us a home.

I doubt they'd be too pleased with us. If there really were aliens watching us, I'm sure they would have given up after Fred Durst sold a bazillion albums.
