I think you've misunderstood the abbreviation. 525M/600M doesn't stand for the memory. It stands for the core speed. 525Mhz.

On-Topic. My card is running slightly lower than the 600M version. My current speeds are. 577Mhz Core. 776Mhzx2 Memory speed, I've had it hit 86c underload. All in all it does its job well for £100.

How long you had that card for?

I had this card in my computer since 22nd Jan. (My bday) but i've had the card since 10th Jan.
