I wouldnt say Vista is the problem, one of my PC's use wireless internet and Vista and the setup went smooth, Recheck what you plugged into the router/PC again

Most routers have 5 ethernet ports, 4 for PC's 1 for the modem or line in for bandwidth. SAME THING.

Usually the plug for the modem is on the very side, sometimes left, sometimes right, make sure the short ethernet cable from the MODEM is in the modem plug on the router

If your gonan hook up PC's then have ANOTHER ethernet cable go into any plug in 1-4, then to the PC. Usually this is instant, so there is no driver needed so just plug and surf the net.

If your trying to use wireless, make sure you have a wireless card or usb adapter, i reccomend USB adapters because they work on both old laptops without built in, and new computers. Scan for signals and see what it does, Usually isb adapters DO need drivers, usually you install the software THEN plug the usb adapter in, maybe this is what is causing you trouble in the part where you get a signal, but no actual data.....

Who knows.
