---

I've put everything together and it runs. But whenever I turn it on, I get a weird continuous beep. I think I accidentally smudged a little bit of the CPU's thermal grease. Anyone know what might be causing the beep?

Specs: (Really crappy I know but it's a first time)

Processor: AMD Sempron 3200+

Motherboard: ECS Geforce 6100SM-M

RAM: 1GB DDR2 667 Buffalo

450Watt MidATX 24Pin PSU

80GB IDE 7200RPM 8MB Cache (I think)

16X +- DVD-RW SAMSUNG

Thanks in advance.
