razorblade001 wrote on Thu, 04 October 2007 23:39: So therefore, the sound wave is going out so far that it dissipates before anyone can hear it, and thus there is no sound to be heard! Saying that means you admit to there being sound... just not one heard by human ears.

razorblade001: Just because the sound wave is there doesn't mean that it is going to make a sound. Just because it can't be heard by humans doesn't mean it doesn't make a sound. Dogs can hear higher frequencies than humans can, but would you dare say that it's not a sound because WE can't hear it?

razorblade001: Think of it this way: A sound can't exist if it cannot be heard.

For example, say your definition. To you, sound doesn't exist. It may be all around, but specifically to you, sound doesn't exist.

So a spirit can't exist because it cannot be seen? So atoms didn't exist until they were seen microscopically? Other galaxies didn't exist until they were seen telescopically?

Just because circumstantial situations prevent the said object to be seen/heard doesn't mean that it doesn't exist.

Just because, to you, seeing is believing doesn't mean that a god or gods cannot exist. It's a ludicrous assumption.
