When i try to run renegade it just crashes as soon as i start it. I've tried reinstalling many times, I've formatted and reinstalled windows. I tried with and without various versions of Jonwil's scripts.dll. I downloaded an ISO of the installer and tried that, which worked until i installed scripts 3.4.4 then it broke again and wont work again either. I've restarted more times than i can count. I've also downloaded and installed latest drivers, directX (9c). It's always worked until now of course. I've not changed anything hardware wise. Can't think of anything else to try. No crash dumps. Although, i do have an `_except.txt` (this is without the custom scripts.dll).

nvidia gforce 6
