The wattage rating of a PSU (which may be false and/or misleading) has next to nothing to do with a PSU's factor of being good anymore. Quality is number one, and +12V rail rating is number two. Sure, you don't go out and buy a 300 watt PSU expecting it to power a high-end CPU, multiple drives, and a duo of high-end VGA cards, but you'd be surprised how many people a decent quality 400 watt PSU will provide just fine for.
