StealthEye wrote on Wed, 11 June 2008 11:35 Depends on your definition, simple as that.

Same goes for facts... What's a fact? Something that is definitely true? How do you measure that? Something that has been scientifically proven? It always depends on definitions and assumptions.  $2 + 3$  is only 5 if you define what 2, 3 and 5 mean.

Define fact as "something of which you know it is real/exists". Then using fact is perfectly fine.

I don't see why nature would give any hint on anything supernatural existing. Also, if some sort of god exists, how did he get there? Was he created? By who?

I don't say it's impossible for God or or anything supernatural to exist, it's just that I don't see any reason to assume why he would. I'd just as easily believe that we live in something like The Matrix, or that nothing exists at all (dreams? does the world in dreams exist?), or everything exists.

If you want my opinion, I'd say we don't exist at all, or that everything that can be imagined exists.

Heh, this is in no way a poke at you, but take an Epistemology course. I think you would seriously enjoy that.
