i have 5200x2 amd 2.5ghz*2 cpu, 4 gigs of ram at 800mhz, and an 8800gt superclocked vid card.

running on win vista, and playing ren on 50 people server it stays at 60 the whole time, since 60 is the most my lcd monitor can take. so im guessing i could easily get higher fps if i had a crt monitor.

well atleast it used to be like that till my 8800gt died last week... now im stuck with 8500gt while i am doing the whole RMA thing
