Or, y'know, never leave your computer on when you're not using it.

Not an option - It's running a fileserver for the house and media server for all the TVs.

madrackz wrote on Mon, 11 August 2008 10:07If its at night close your windows/doors at your room, its same for normal lamps etc. and you didnt failed.

Southern California with no A/C means windows and doors must be left open. Somehow the bugs get indoors even when they're closed though. BUGS = WIN.

cmatt42 wrote on Mon, 11 August 2008 11:02You had filters installed too, right?

Filters installed on the fans, but there are all kinds of little holes on the back of the case that a bug can squeeze through if they put their little mind to it.

Aircraftkiller wrote on Mon, 11 August 2008 15:09DJ! OMFG! I haven't seen you in years! What's good dude?

What's up ACK? Nice to see you're still around here!

JPNOD wrote on Tue, 12 August 2008 00:19 Ile take thats DDR3

BTW is that Raid 5 array software or hw raid and how is the read/write performance with HD tune if I may ask

Yeah, DDR3... Haven't actually tested the HD performance, but I'll do that. The reason for the Raid 5 is for capacity + a small amount of redundancy... If I wanted performance I'd get a drive based on flash memory!

So for the quick update, I've disconnected the cathode light and now it's not a problem anymore. Now they just flock to my glowing mouse pad.
