That's unusual. I like unusual problems

Can you open your hosts file ("C:\Windows\System32\Drivers\Etc\Hosts" in Vista and XP, open it with Notepad) and remove the entry probably looking like:
"64.34.46.60 c.xwis.com" (remove any entry that has "c.xwis.com" on that line)

c.xwis.com is 64.14.244.60, NOT 64.34.46.60, which is what your system thinks it is.

Problem freaking solved. (I hope)
