Precisely why I suggested javascript first. *cough*

Mind you, the only reason I wrote the javascript like I did was for it to be easiest to understand while remaining fully functional.

```
<html>
<head>
<title>Your page name</title>
<script type="text/javascript">
<!--
function proc_form(obj)
{
var correct_spell = "correct_spelling_here";
var word_entry = obj.the_word;
if ( word_entry == "" )
{
alert("Please enter a word to spell.");
}
else
{
if ( word_entry.value == correct_spell )
{
alert("You have correctly spelled " + correct_spell);
}
else
{
alert("Please try again.");
}
}
return false;
}
-->
</script>
</head>
<body>
<form onsubmit="javascript:return proc_form(this);">
<input type="text" name="the_word" />
<input type="submit" value="Check Spelling" />
</form>
</body>
</html>
```
