Air horn- game over.

Otherwise, you could try high-frequency background noise. Think CRT noise, only a lot louder. If they can hear it, the sound is guaranteed to drive them absolutely bat shit crazy. To anybody sensitive to that frequency range, it's like a goddamn dog whistle- I can hear a floor above and across the house when the TV in our living room is on, and it is distracting to no end to have a CRT on anywhere nearby when I'm trying to get something done (sleeping, writing, thinking, etc). For that matter, I can't tolerate having a CRT on at all if there isn't some normal sound to mask it.

Experiment a little- find out if they're sensitive. If they are, crank it way, way up at the most inconvenient times. If they're not-terribly-brainy types, they may not ever even figure out what you're doing.
