This is probably a stupid question but....

Anyways, i got my linux fds installed and working so it works on gamespy. I got all the perl
modules etc... that are supposed to be installed to get xwisp to load. So anyways when i try and
load xwisp i get the error "Cannot chdir to /root/Server (this is the directory my linux fds is in) No
such file or directory at ./xwisp.pl line 149.

My linux fds is located under /root/Server so it's just blowing my mind why xwisp can't find it!

Like i said i've probably made a stupid mistake somewhere but do keep in mind that i do not know
a thing in linux and i've been basically just following instructions to get this set up. My operating
system is CentOS5 if that helps.

Thanks.
