andr3w282 wrote on Sun, 01 March 2009 13:46it all depends what you wanna do

Learn the ideas of algorithms ? (basic)
Learn fundamental ideas (ex. arrays) (basic, php, java)
Learn procedural based ? (C language)
Learn object oriented ? (C++, php, and vb.net, java, c#)
Learn syntax ? (java, c++)
Learn performance ? (c++)
Learn how actual programs work ? (depends)
Learn the lower levels (c++, asm)
Client applications? (c++, vb[.net], c#, java)
Web applications? (php, asp, java)

You haven't outlined what you do and do not know. You can just say im going to "learn programming" because theres so many levels to each language and why. Nearly every language can do some form of the other, but it all depends on how and why you want to do it.
Well Never knew there were levels of programming but thats why I want to learn i just some are easier then others, But I want to write up codes and make something out of nothing

I mean should I just go straight to what my gaol is (c++) or do you guys think I should start small (java) to see if I get the conecpt and get the hang of it

I would like to write up applications but maybe do some java work since I noticed java comes in handy and especially stuff for like my phone uses all java

So seems like c++ and java is what am probably going to go for

PS thanks for replying
