Yeah dude, if you want to play games with good FPS on a laptop, notebook, what ever....your gonna need a lot of money to get something.

Renegade relys on Processor, RAM, and Graphix Card.

You say you have an 8 MB graphix card? I have a 128. Its also a GeForce4 TI 4600. And its Titanium. o_O

I have 512 SDRAM and I cant upgrade anymore..shitty 2 y/o dell PC. How much RAM do you have?

I have a 1.4 Ghz processor. What processor speed do you have?

It all plays a part in it. I can turn my graphix down to shitty mode and I get (in 4 player games) about 60 + FPS. In 8 players, about 40ish. And in 24 players, I get about 20-40. All this FPS depends on the situation. If Im sniping a bunch of basic infantry, Ill get max. If Im running around a room full of 10 engineers shooting their repair beams fighting off 7 flame tanks while some techs run in and blow up some remote C4s, Ill get about 2-20.

Explosions/Fire/lots of "beam guns" (like volt rifle, repair beams) = lots of lag.

Try playing in small servers with your graphix on shitty mode. It should be playable.

Think of it this way. Practice like this. When you get a leet PC, you willbe an unstoppable sniper...like ACK....who I swear is invincible...
