hi,

We are two guys without any knowledge of renegade linux servers and dont know for what to google- but we want renegade to be resurrected in germany!!

well, my friend cant speak english and i dont have any expirience in playing or hosting renegade.

here ist what we have and what we need.

i found some posts on the net of people who got renegade for redhat 8.0 running on debian 3.0 without modifications and recompiling. i have a rootserver with debian 4.0 . now i am looking for any tutorials how to set up the dedicated server to run and to be listet on WOL (xwis)

my linux knowledge is ok- im not an pro but i´m a practised user and admin.

are there any useful turorials out there or is there anyone who can support us? the renegade-server will be our 5th gameserver. the jtp cooperation is a small german community and we are running a cod uo server, cod2 server, we are supporting and hosting a private css server and also a private wow- testrelam.

and now we hope to get the renegade community in germany back 2 life.

thanks for any help and support ;)

by the way- sorry for a question that surly has been posted several times, but as i told you: i dont have ANY glimpse what to search for by using google or your built in search engine.

regards: Jack alias Alexander
