As for liquid cooling, I can't give much advice but this thread is a very good guide.

From what I do know, you really have to know your stuff. In all honesty, unless you're going to be overclocking to the extreme, go with air-cooling. It costs quite a bit of money to pull off a liquid setup, money which could be saved, or used towards a better graphics card, or a Core i7 setup if you need more multi-tasking power.

I might over clock, im not sure yet, that mobo even has an oc dial on it. but im not sure yet which si why im learning about LC
