Unless you're planning on doing an extreme overclock, there is no real benefit other than for looks/project. I have water cooling -> <http://www.youtube.com/watch?v=aklor2rgNwA>

It looks pretty sweet, my temps are great and it's fairly quiet. I wouldn't worry about parts leaking as long as you test it properly, ie hook everything up and plug the pump into another computer, or use a jumper so if there is a leak you won't fry anything. There is no such thing as non conductive as far as coolant goes, just use distilled water. It'll be better than any of those fake coolants.
