The emails didn't prove it was a scam, they showed that people were exaggerating and falsely presenting data in order to get others to take it seriously.

Climate change is real, the planet does have a higher average temperature than it did when we first started recording this data, and the polar ice caps have shrunk. Those facts are not debatable. What caused those events to occur, and what these events will cause is what's in debate. Politicians and news stations are the last places on earth you should be turning to for scientific information. If global warming is a subject you want to take seriously I suggest you educate yourself based on reliable and credible sources, not pop culture.
