First thing I'd do is to switch the sticks, and see if you get that error again. Memory should go in and out with no issue, and with very gentle force. Just make sure everything lines up.

Hopefully that'll be what does it.

Bad memory happens and I've had it before; sucks eh? However, I've used OCZ stuff myself, and didn't have an issue.

If the install goes through with one stick, I'd contact newegg and see what they say. You might be able to RMA through them, or head to OCZ and see what they say.

Here's OCZ's support: http://www.ocztechnology.com/support/

Keep updating here, and good luck.
