Over clocking my Phenom II x4 955

from I believe 3.2 to 3.5 ghz

I get a normal temp around 41C/105F

Is that to much heat?

once in while jumps to about 113F but mainly for 2 seconds then goes back around to it, but as i said it does happen rarely

so is it to hot?

by over clock i increased FBS to 215 from 210  
and increase multiplier to 16 from 15'

so is it to hott?

FTW i dont have a stock heat sink/fan I have hyper N520 and a case system which tons of fans suck air in blow through cpu and out back of case
