In your query your checking if uid is equal to something, but then you try to echo id, do you have both a uid and id field in that table?

You might want to do something like this to check what results your actually getting back;

```
$query = mysql_query("SELECT * FROM table"); // Query here
echo "Query returned ".mysql_num_rows($query)." results;<br/><pre>"; // Output number of
results
while ( $result = mysql_fetch_assoc($query) ) // Iterate through each result row
{
    print_r($result); // Dump contents of current result row
    echo "<br/><br/>"; // Leave a gap between each result row
}
echo "</pre><br/>End of results<br/>";
mysql_data_seek($query,0); // Reset results pointer
```

FYI: The `mysql_data_seek()` call at the end just tells PHP to set the results pointer back to the first row so you can still process the results in the code which follows that block of code.
