I am, I just can't seem to 1) Make the game save my config settings no matter which way I try to modify the config (wwconfig, in-game, modifying sysinfo.txtm etc).

And 2)It won't let me lower OR raise the texture detail.

My card is some crappy on-board Radeon Xpress 200 series. Only 64 MB. Again though, It's an issue I can deal with as I'm still getting 30-70 fps. It would just be nice to lower the texture detail for maps like "fjord" where I can like 10 fps :S

I dunno if the card is the issue though. I don't think the game is auto-detecting the best settings for me as the settings are my pre-tt patch default only with the geometry detail cranked up (with detail set to lowest, but still on medium/high detail).

Maybe if later on a way to manually save your graphics settings was added to the in-game menu it could help (like how you can for the controls) ?
